ANDROID

REAL-TIME OPERATIONS

Product overview / July 2026

One operational record for every vehicle and trip.

The conversation becomes the shared timeline for people, decisions and delivery progress.

Dispo Chat combines the speed of messaging with the structure required by transport operations.

Instead of switching between chat applications, spreadsheets, maps, calls and document folders, teams work from one synchronized workspace.

01 Chat-first

Communication remains the fastest way to coordinate daily work.

02 Trip-aware

Each room can carry structured trip, stop and vehicle context.

03 Driver-ready

The Android workflow follows the trip from acceptance to delivery.

04 Company-ready

Roles and permissions keep collaboration controlled.

WHY IT MATTERS

Transport coordination is fragmented.

Critical context is often distributed across tools and people.

01 Messages

Operational decisions disappear inside generic chat threads.

02 Trips

Stops, references and assignments are re-entered repeatedly.

03 Status

Dispatchers depend on calls for progress updates.

04 Documents

Proof of loading and delivery arrives late or without context.

THE DISPO CHAT APPROACH

Keep communication, trip data, route progress and documents on the same shared timeline.

Messaging designed for operational teams.

01 Real-time chat

Direct and group conversations with reconnect-safe updates.

02 Presence and typing

Live availability and immediate collaboration signals.

03 Replies and mentions

Keep fast-moving conversations understandable.

04 Search and pinning

Retrieve important messages without leaving the room.

05 Files and previews

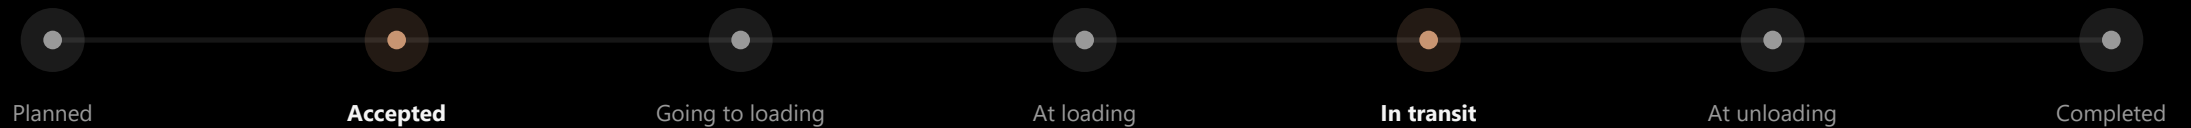

Review images and documents before sending.

06 Personal drafts

Drafts remain private and tied to each conversation.

The trip lives inside the vehicle room.

Vehicle identity and assigned drivers remain stable until dispatch changes them.

A Permanent vehicle room

Tractor, trailer, members and assigned drivers stay connected between trips.

B Structured stops

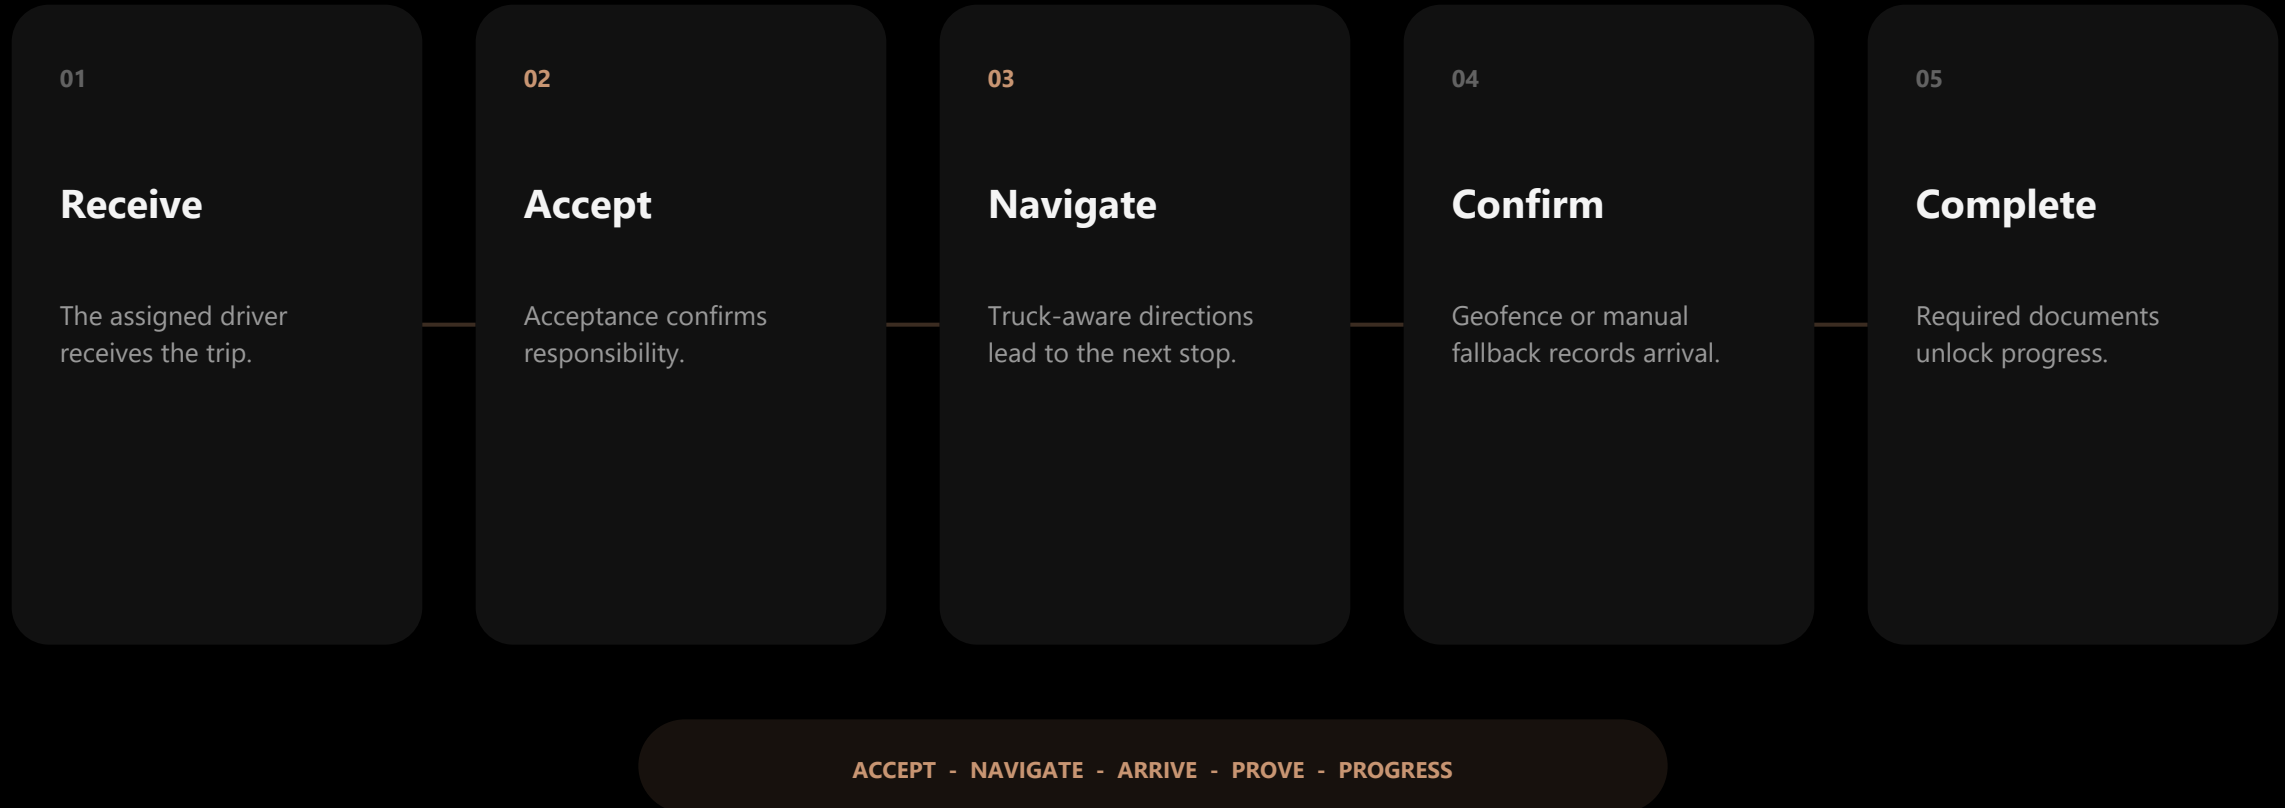

Loading, unloading, references, time windows and route details remain visible.

C Live synchronization

Trip changes update desktop and Android through the same operational state.

A compact workflow built for the road.

The Android app prioritizes clear status, one-hand actions and minimal navigation.

Routes, location and proof work together.

ROUTE AND LOCATION

- HERE truck routing
Routes can consider HGV dimensions and restrictions.
- Multi-stop navigation
Loading, unloading and intermediate stops share one route.
- Foreground location
The active trip can send progress while navigation is open.
- Geofence confirmation
Arrival is confirmed after the driver remains near the stop.

DOCUMENT CONTROL

- Attachment preview
Drivers review images and documents before sending.
- Automatic scanning
ML Kit captures and cleans paperwork visible in frame.
- Proof-required transitions
Protected status changes require the correct documents.
- Manual fallback
The driver can progress when GPS confirmation is unavailable.

One platform, synchronized in real time.

Different roles, one shared source of truth.

ADMIN

Workspace, company and access control

DISPATCHER

Trips, drivers, routes and exceptions

DRIVER

Navigation, status and transport documents

PARTNER

Controlled cross-company collaboration

EXPECTED OPERATIONAL VALUE

- Less time spent asking for updates.
- Clear ownership for every active trip.
- Faster access to route and stop context.
- Documents attached to the correct event.
- A continuous history from dispatch to delivery.

From conversation to completed delivery.

A transport workspace where messaging, trips, drivers, routes, status and documents remain connected.

- 01 One shared operational timeline
- 02 Desktop dispatch and Android driver workflows
- 03 Real-time trip progress with controlled proof
